This is the 84th Data Report
from the Western Region, Winnipeg

PREFACE

This study was funded by the Northern Oil and Gas Action Program (NOGAP), through the Department of Fisheries and Oceans, Western Region. It is one of a series of projects being executed under NOGAP B.2, to provide background data for assessing the implications of hydrocarbon development and production on critical estuarine and marine habitats of the Canadian Arctic Coastal Shelf. This document constitutes NOGAP Report B2.8.

ABSTRACT

Hopky, G.E., D.B. Chiperzak, and M.J. Lawrence. 1986. Seasonal salinity, temperature and density data for the Canadian Beaufort Sea Shelf, 1984-1985. Can. Data Rep. Fish. Aquat. Sci. 593: iv + 249 p.

This report contains salinity, temperature and density data collected by the Department of Fisheries and Oceans, Western Region in the nearshore waters of the Canadian Beaufort Sea Shelf during 1984 and 1985. Salinity and temperature profile data were measured using a Guildline Model 8870 probe deployed from the M.V. Sequel during July and September, 1984, and July to September, 1985, and from the ice surface in March and May, 1985. Salinity and temperature values for samples collected from occasional bottle casts were measured with an Autosal Model 8400 salinometer and mercury thermometer, respectively. Density was calculated using salinity and temperature values. When appropriate, ice thickness or secchi depth was measured.

Profiles were measured at 16 stations in 1984. During the ice cover periods of March and May, 1985, a total of 30 station profiles were measured. For the open water, July to September, 1985, period 47 station profiles were measured with an additional eight stations sampled using bottle casts. Annual and seasonal differences were evaluated at a number of stations.

The depth range of profiles measured during the open water periods was from 1.3 to 123.3 dbar. During the same periods profile measurements of salinity and temperature ranged from 0.03 to 33.10 and -1.71 to 9.32°C, respectively. Depths of profiles measured from the ice surface ranged from 3.7 to 35.3 dbar. Salinity and temperature measurements ranged from 0.04 to 32.53 and -1.73 to 0.20°C, respectively. Ranges for data from bottle cast samples were similar.

Key words: Arctic; coastal waters; salt-wedge estuaries; freshwater; salt water; thermocline; halocline; pycnocline; oceanographic data; secchi discs.

RÉSUMÉ

Hopky, G.E., D.B. Chiperzak, and M.J. Lawrence. 1986. Seasonal salinity, temperature and density data for the Canadian Beaufort Sea Shelf, 1984-1985. Can. Data Rep. Fish. Aquat. Sci. 593: iv + 249 p.

Ce rapport renferme des données sur la salinité, la température et la densité qui ont été recueillies par le ministère des Pêches et des Océans, région de l'Ouest, dans les eaux côtières du secteur canadien du plateau de la mer de Beaufort au cours de 1984 et 1985. Les données du profil de salinité et de température ont été obtenues à l'aide d'une sonde Guildline, modèle 8870, utilisée à partir du SEQUEL au cours de juillet et de septembre 1984 et de juillet à septembre 1985, et à partir de la couche de glace en mars et en mai 1985. Les valeurs de la salinité et de la température pour les échantillons recueillis à l'occasion au moyen d'échantillonneurs ont été mesurées au moyen d'un salinomètre Autosal, modèle 8400, et d'un thermomètre à mercure respectivement. La densité a été obtenue par calcul au moyen des valeurs de la salinité et de la température. On a mesuré l'épaisseur de la glace et la transparence de la mer au moyen de disques de Secchi lorsqu'il avait lieu de le faire.

Les profils ont été mesurés à 16 stations en 1984; au cours des périodes de mars et de mai 1985, alors qu'il y avait une couche de glace, 30 profils de station au total ont été mesurés. Pendant la période où l'eau était libre, de juillet à septembre 1985, 47 profils de station ont été mesurés et des échantillons ont été prélevées au moyen d'échantillonneurs pour établir le profil de huit autres stations. Les différences annuelles et saisonnières ont été évaluées à un certain nombre de stations.

Les profils mesurés au cours des périodes où l'eau était libre l'ont été à des profondeurs variant de 1,3 à 123,3 m. Au cours de ces périodes, les mesures de profil de salinité et de température variaient entre 0,03 et 33,10 et -1,71 et 9,32°C respectivement. Les profils mesurés à partir de la couche de glace l'ont été à des profondeurs variant de 3,7 à 35,3 m. Les mesures de la salinité et de la température variaient entre 0,04 et 32,53 et -1,73 à 0,20°C respectivement. L'écart applicable aux données tirées des échantillons recueillis au moyen d'échantillonneurs était similaire.

Mots-clés: Arctique; eau douce; eau salée; eaux côtières; halocline; lame d'eau salée dans l'estraire; pycnocline; thermocline; données océanographiques; disques de Secchi.

INTRODUCTION

The salinity, temperature and density data presented in this report were collected as part of the Critical Arctic Estuarine and Marine Habitat Project (B.2) of the Northern Oil and Gas Program (NOGAP). The data represent one component of the oceanographic measurements made by the staff of the Department of Fisheries and Oceans, Western Region on the Canadian Beaufort Sea Shelf (Fig. 1) during 1984 and 1985. Similar measurements will be made during 1986 and 1987 and subsequently published. In addition, light attenuation (PAR - Photosynthetically Active Radiation) and chlorophyll a data are being collected and will be published separately.

A major objective of this NOGAP project is to identify ecologically important marine and estuarine habitats on the Beaufort Sea Shelf (<200 m). This region is believed to be a major breeding and feeding area for bowhead whales, Balaena mysticetus (Fraker and Bockstoce 1980; Würsig et al. 1985) and white whales, Delphinapterus leucas (Norton Fraker 1983; Norton and Harwood 1985). Similarly, this region is also important to marine and anadromous fishes (Craig 1984; Lawrence et al. 1984). However, there is very little information about the underlying biological (e.g. food resources) and physical factors that determine the life history characteristics of these populations (Borstad 1985).

The salinity, temperature and density data presented here are physical factors critical to identifying and delineating the amount and extent of different water masses. This information is being collected in conjunction with biological sampling: primary productivity, zooplankton, and larval and adult fish life history studies. Both of these objectives - defining the amount and extent of potential habitat types, and describing the biotic groups that are found there - are necessary to the overall objective of assessing the importance of different habitats to aquatic productivity and to their potential vulnerability to perturbation.

The M.V. Sequel, a wooden hulled 12 m vessel, was chartered to conduct sampling during the open water periods of July and September, 1984, and again during July, August and September, 1985. A DH6 (Twin Otter) aircraft equipped with wheel skis was used during March and May, 1985, to conduct sampling from the ice surface. The data reported here are from an area that extends from Herschel Island on the west to McKinley Bay on the east, out to the 150 m isobath from shore (Fig. 2).

METHODS

DATA COLLECTION

Positioning

In 1984 station locations were obtained using a combination of radar (Furuno Model CR240) fixes to shore, bathymetric charts and a Magnavox Model MX4102 satellite navigator with a nominal accuracy of ±0.1 km.

In March and May, 1985, all stations except two were reached with a DH6 (Twin Otter) on wheel skis equipped with Global Navigation System (GNS) positioning equipment. Stations 85051 and 85052 were reached by truck and located by identification of nearby shore landforms and odometer distance from Tuktoyaktuk.

During July, August and September, 1985, stations were located as in 1984 except that a JRC Model JLE-3850 satellite navigator was employed with a nominal accuracy of ±0.1 km.

CSTD system

Station profiles were taken using a Guildline Model 8870 portable CSTD system consisting of a deck unit, a probe and an Arctic Model winch. The deck unit is powered by 2-12 volt batteries. The unit's microprocessor computes salinities using the UNESCO practical salinity scale 1978 (UNESCO 1981). The deck unit is equipped with an IEEE board as well as a digital display. Output was recorded on magnetic tape using a portable audio cassette recorder. The winch was fitted with a single conductor oceanographic cable.

An Arctic Model probe was used throughout 1984 and for all of 1985 except during September when the Open Ocean Model probe was used. Probes were calibrated biannually and fell within accepted accuracy ranges. Accuracy ranges for the sensors on both probes are: temperature ±0.01°C, salinity ±0.02‰ and pressure (dbar) ±1%. A spare deck unit was used for part of August, 1985 until a malfunction in the main unit was repaired.

Bottle casts

Bottle casts were made using a 5 litre Van Dorn sampler. Conductivity ratios were obtained using an Autosal Model 8400 salinometer. Salinity was calculated using the UNESCO practical salinity scale 1978 (UNESCO 1981) on a Zenith 151 microcomputer. Temperature was taken from the water sample immediately after it was on the vessel deck, using a mercury thermometer (±0.5°C).

DATA PROCESSING

CSTD data was edited using a Zenith 151 microcomputer. Means of salinity and temperature were calculated for multiple readings at a single pressure (dbar) point. Density was calculated using the international equation of state of seawater 1980 (UNESCO 1981) on an Amdahl 58-50 computer. For those situations when a probe sensor appeared to have malfunctioned, data for that variable was deleted from the records.

RESULTS

Tables 1 and 2 contain summary descriptions of the stations sampled in 1984 and 1985, respectively. Profiles were measured at 16 stations in 1984. During the ice cover periods of March and May, 1985, a total of 30 station pro-

files were measured. For the open water, July to September, 1985, period 47 station profiles were measured with an additional eight stations sampled using bottle casts. The station locations are mapped for 1984 (Fig. 3), March and May, 1985 (Fig. 4), July, 1985 (Fig. 5), August, 1985 (Fig. 6), and September, 1985 (Fig. 7). Annual and seasonal comparisons were made at a number of stations (Fig. 3-7). These figures also showed that with the exception of the March and May, 1985, periods of ice cover plankton sampling was conducted at virtually all stations.

Stations were generally sampled between 1400 and 0100 hours Greenwich Mean Time (GMT) over total depths ranging from 2 to 150 m (Tables 1 and 2). When appropriate, ice thickness or secchi depth was measured. Equipment malfunction, and heavy seas that prevented stationary mooring, resulted in the taking of either surface or profile bottle casts during the August 3-6, 1985, sampling period (Table 2). Other stations where CSTD profiles are not available were due to equipment malfunction or human error. Data for stations 85200 to 85203 (Table 2) were not recorded on magnetic tape, but manually in the field log.

Note that the maximum profile depths (dbar) measured during the August 9-12, 1985, period are generally greater than the measured total depth (m) (Table 2). However, salinity data values observed at the maximum depth (dbar) of each profile correspond to that recorded in the field log when the probe was nearest to the bottom. This discrepancy may be related to the use of a spare deck unit during this time period.

CSTD data are tabulated by station and date in Appendix A, Tables A1.1-A1.101. Plots of the data are shown on the facing page, with the corresponding station number and sampling date. Density, in $kg \cdot m^3$, is plotted as sigma t (density-1000). Depths are expressed in pressure units (dbar) except for the August 3-6, 1985, bottle cast data which are in meters.

The depth range of profiles measured during the open water periods was from 1.3 to 123.3 dbar. During the same periods profile measurements of salinity and temperature ranged from 0.03 to 33.10 and -1.71 to 9.32°C, respectively. Depths of profiles measured from the ice surface ranged from 3.7 to 35.3 dbar. Salinity and temperature measurements ranged from 0.04 to 32.53 and -1.73 to 0.20°C, respectively. Ranges for data from bottle cast samples were similar.

ACKNOWLEDGMENTS

The authors would like to thank G. Lacho and L. de March, DFO Winnipeg, for their assistance in the data collection. The skippers of the M.V. Sequel were L. Pearson (1984) and W. Bellham (1985). Twin Otter pilots were H. Hanlan and D. Bowes. Their considerable skills and dedication are gratefully acknowledged.

We thank the Polar Continental Shelf Project of the Department of Energy, Mines and Resources for logistic support in Tuktoyaktuk. Personnel of the Atmospheric Environment Service in Tuktoyaktuk were very helpful, as were discussions with H. Mellings, DFO Sidney, BC, and R. Hesslein, DFO Winnipeg.

Salinometer readings were made by L. de March. Assistance by DFO support staff, L. Taite, R. Lypka, and C. Catt in Winnipeg is appreciated.

Station: 85217 Date: Sep 12

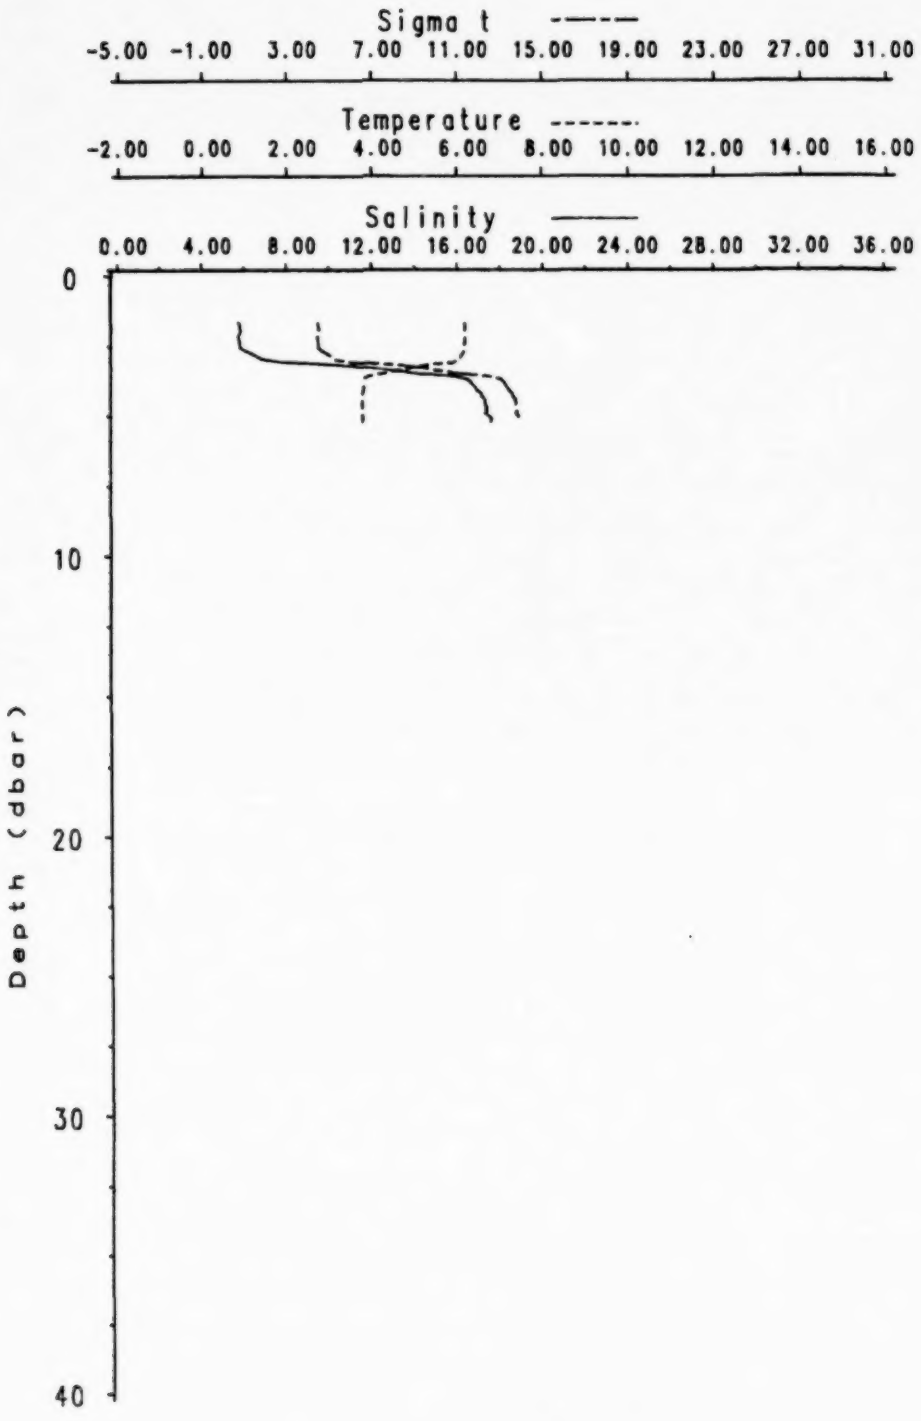

Table A1.101. Salinity, temperature (C) and density (kg.m**-3) data by depth (dbar) for station 85217, September 12, 1985.

Depth	Salinity	Temperature	Density	Depth	Salinity	Temperature	Density	Depth	Salinity	Temperature	Density
1.7	5.80	6.21	1004.53	3.1	7.83	5.93	1006.15	4.4	17.39	3.83	1013.82
